

Can Rocks Communicate With Each Other?

Don & Diane Wells © 2019

Peter Wohlleben in his bestseller book, *The Hidden Life of Trees* introduced the world to the fact that trees communicated with each other. Dr. Suzanne Simard, Professor of Forest Ecology, University of British Columbia, Vancouver expanded on Wohlleben's work and proved scientifically that, in fact, the trees shared resources through an interwoven-system of roots and fungi. When one tree was in need of support, it communicated that need to the rest of the trees and resources were released from storage to help the tree in need. As living species, it is easy to

understand this relationship. But what about inanimate objects such as large rocks or megaliths. Can they communicate as well?

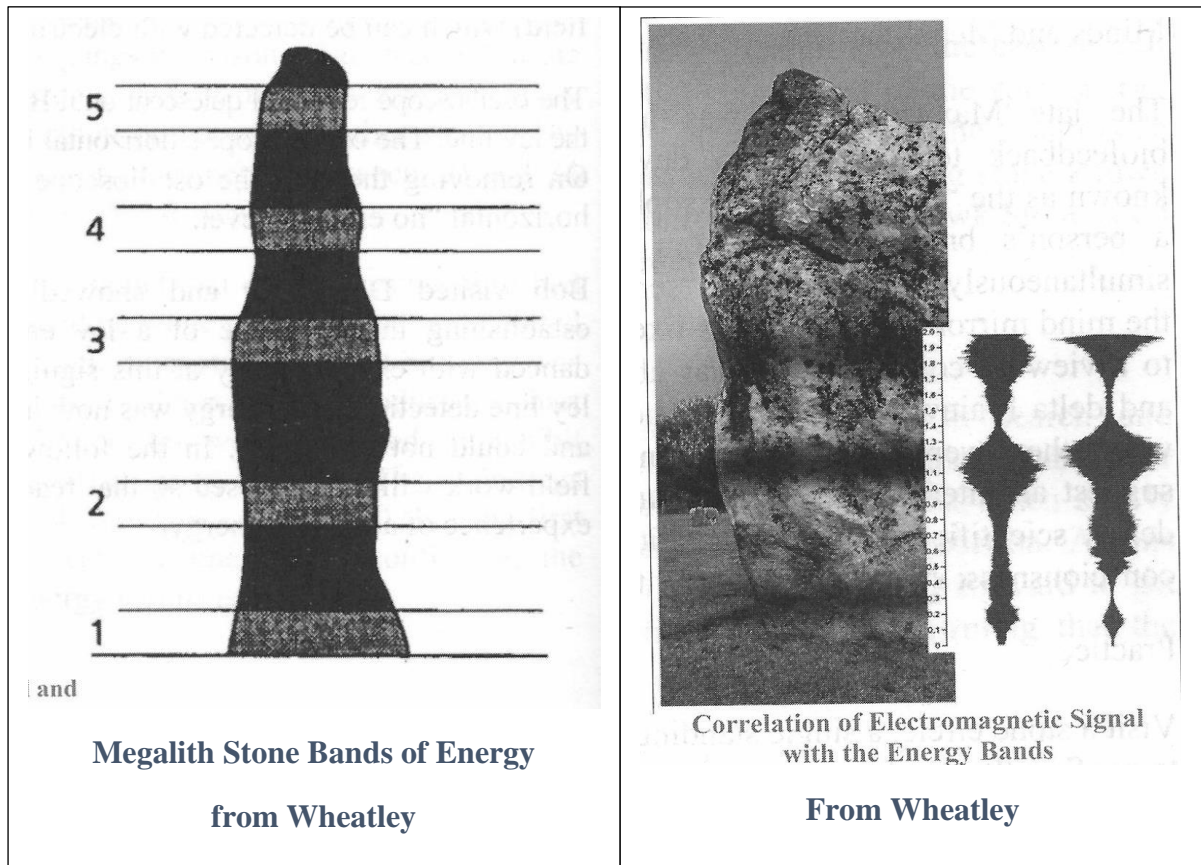

Don Hill interviewed Dr Leroy Little Bear, Blackfoot Indian, as they walked about Writing-on-Stone Provincial Park in Alberta, Canada in 2008. His article, published in Alberta Views, was titled *Listening to Stones*. In that article, Dr Little Bear shared his view of the spiritual connection to place. He told Don Hill that, "The native paradigm consists of several key things. One of them is constant motion or constant flux. The second part is everything consists of energy waves. In the Native world, the energy waves are really the spirit. And it is the energy waves that know. It is not you who know, it is the energy waves that know. You know things because ~~you~~ we are also made up of energy waves. or a combination thereof."

As they walked about the park Dr. Little Bear share his view of the stones in the park and what knowledge they could share if they were open to sharing. Dr Little Bear said, "Think of their age. The stuff they must know! Yet the "teaching rocks" are somewhat careful about sharing their counsel. When I first visited Writing-on-Stone as a young man in the 1970s, I sensed there was a whole lot going on here that I could not get my head around. Like a stranger, they will not sit down

and tell you everything immediately. Only when the rocks begin to know you will they tell you their story.”

Dr. Little Bear’s understanding of “talking rocks” is confirmed in two books published in the United Kingdom. Guy Underwood book, *The Pattern of the Past*, was published in 1969 after his death. His extensive research of monuments such as Stonehenge and others showed that there were indeed energy forces interconnecting these megalith structures both within the structure features and with other monuments some distance away. Dennis Wheatley in his book, *The Essential Dowsing Guide* went on to show scientific research of the energy flows from rock structures.

Wheatley reported in his book that Dr. J. Havelock Fidler, a retired scientist, had heard people talking about the possibility of energy passing between megaliths so he decided to see if it were true. Dr. Fidler tested a number of stones in an area known as Loch Shielding, Scotland. Wheatley reported that, “Fidler discovered that each stone was transmitting aerial energies to other stones in the region. Some stones had as many as seven aerial beams passing through them.” Fidler’s work was expanded upon by Bob Sephton, an electrical engineer who used a copper coil and an oscilloscope to measure the energy bands from the megalith stones. For the most part, they discovered five bands of energy above ground as shown in the diagram below. Analysis of this phenomenon by Wheatley determined that, “When a standing stone is rooted into an earth energy pattern, such as a Geospiral, Ley line, or earth current, it absorbs and transmits the energy. The

energy forms an organized and coherent series of nodes or bands of energy.” Rodney Hale, an

expert in measuring and analyzing electromagnetic energies, and Dennis's daughter Maria, conducted further experiments which showed the magnitude of the electromagnetic energy emanating from the megalith stones at each level. They concluded that Band 2 is for aerial transmissions to local stones such as those in a circle around a particular stone. Band 4 is for long distance transmissions to other megalith sites across the landscape.

Since stones are inanimate and have no root or other form of physical connection, it is hard to contemplate any back and forth communications. However, Wheatley reported that Maxwell Cade, a pioneer in the field of biofeedback techniques showed he could measure deep theta and delta brainwave changes in people when they were standing close to standing stones. Wheatley said, "Every stone in a circle engages with every other stone in energetic frontal "crosstalk." Wheatley further showed that in some megalith stones, they had a particular energy pattern around the stone which he found using dowsing. This pattern shown below has concentric rings of energy that are positive and negative in alternating rings and energy lines aligned to N-S, E-W and at the 45-degree directions.

Field Experimentation

Two sites in Alabama where megalith stones exist were visited to make field measurements using dowsing. No scientific measurements were made since we do not have the capability to duplicate Wheatley's and his colleagues' experiments.

Near the Guntersville, AL Dam on the Tennessee River is a rock site that we have been investigating for about ten years. This site has a megalith stone standing probably 30 feet high and only a few feet thick. Adjacent to the standing stone is a recumbent stone which has a special carving that has been interpreted to be associated with healing ceremonies. Heretofore, we had always thought that the healing ceremony was located on the recumbent rock. Now we know differently based on our most recent findings.

The large standing stone at the Guntersville site was determined to have a 49-ring Geospiral directly under the rock. Two energy lines pass directly through the standing stone as well as the

recumbent stone. The medicine for the healing ceremony was prepared on the recumbent stone and the person to be healed was likely placed close to the standing stone where the large energy fields was upwelling from under the stone. A 49-ring Geospiral is the largest that occurs so this had to be a powerful healing site.

Guntersville Standing Stone

Edge View Guntersville Stone

The Guntersville stone was tested to see if energy was emanating from the stone. The answer was found to be “yes” as stated by Wheatley. Using a dowsing rod held in the search position (pointing straight ahead), the rod was placed near the ground adjacent to the stone and slowly raised up along the stone surface. As the rod moved upwards it swung to the found position (90 degrees) when it encountered energy emanating from the rock. A band of energy was located from ground level to about 1 foot above the ground and then again at about 3 feet above ground to about 5 feet. I did not have a ladder to measure all the way up to the top of the stone but felt I was seeing the energy emanate from the rock. I used the rods to ask the questions: “Is Band 2 being used to communicated with local rock and Band 4 with distance rocks?” I got a yes response from the rods. I suspect that Band 2 may be a higher frequency to be received locally and Band 4 may be a lower frequency to be received at further distances. In the area of the Guntersville stone, there are more large stones but they are some distance away so I did not try and investigate them for energy flow patterns. As presented by Wheatley and others, it does appear that energy passing through the rock is absorbed in the rock and then is generated outwardly to communicate with other rocks.

Dr. Leroy Little Bear’s comments about “talking rocks” appears to be “spot on.” These rocks, especially like the Guntersville rock which was used for healing ceremonies, have been witness to many things over a millennium of time. A Creek Indian trail nearby indicates that thousands of

Indians passed this point. Did these rocks absorb the history of this place? Can their knowledge of this place be communicated to us? Are the rocks willing to share that knowledge by communicating with us? Dr. Little Bear thinks some elders may learn the stories if they visit with the rocks long enough.

Little River Canyon National Preserve

This National Park Service Preserve was established in 1992 to protect the scenic beauty of the Little River Canyon in Dekalb and Cherokee Counties, AL. This site was home to the Cherokee Indians who lived in the sandstone canyon of the river. Throughout this area of the canyon are many naturally formed standing stone sites created over a millennium of time. Two large standing stones are located along highway 176 on the west side of the Little River Canyon. The first stone is

Little River Canyon Standing Stone

often referred to as the mushroom rock which is located in the center of the road. This rock was investigated and determined to have a 21-Ring Geospiral directly under it. Associated with the rock are two energy lines which probably caused the Geospiral to form. This standing stone was checked to see if energy emanated from this rock as it did from the Guntersville Rock. There were bands of energy around this rock located about the same heights as the ones discovered in Guntersville.

Directly to the NNE and about 220 feet from the Mushroom rock is another large rock; however, this one is more of large lump about

Little River Canyon Energy Rock

20 feet high and probably 30 feet in diameter. This rock does not have a Geospiral associated with it but there are two energy lines passing through the rock. This energy is absorbed in the rock and the rock then emanates energy identically to what is described in Wheatley's book for patterns involving concentric circles and cardinal rays. The concentric circles of energy are spaced about 6 feet apart and are alternately positive or negative. The cardinal rays of energy were aligned to N-S-E-W and NE-SW-NW-SE. I used the rods to question whether energy was being shared between the two rocks in the vicinity and the I received a yes response.

Future Plans

More sites with standing stones will be researched in the future in order to collect enough empirical data to validate that what Wheatley has shared in his book about England is ~~being~~ duplicated in the US. Further, if we can find an electrical engineer who has experience in field measurements, we will try and duplicate some of the experiments done by Wheatley's colleagues in the UK.
